                                                                                                                                                                        e-mail for correspondence: arab@sequence.stanford.edu
Genes with similarity to proteins in the databases are described as
'putative', '-ilke' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'.
The software programs used to predict genes include: Grail
Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/section/index.html), GENSCAN (chris Burge,
http://sompio.crnl.gov/section/index.html), Fexa (V.Solovyev
& A.Salamov, Sanger Centre, http://genomic.sanger.ac.uk/), and
NetPlantGene (S. M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/NetPlantGene.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KGIKTDLKGYCESWIRINEWINDEWINDEWINDEWINDLKGUEDSSSSUNGIVS

Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'.
The software progrems used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, hear)

Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: seqrefégenoscope.cns.fr - Web: www.genoscope.cns.fr)
This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Saccharomyces Kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.

For the latest information on annotation of this clone, please see http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?~MTO24

Genes with similarity to proceins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein.'

The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/Grail.1.3/), GENSCAN (Chris Burge, MIT, http://CR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and splicePredictor (Volker Brendel, Stanford University, http://gremlini.zool.lastate.edu/cgi-bin/sp.cgi)

Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/cddy/tRNAscan-SE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions. The 5' clone is MWE13 and the 3' clone is T13J10.

XX

DNA coding for aromatic acyl transferase - for transforming plants
PT which produce anthocyanin pigments and thus altering colour tone,
PT e.g. of flowers

XX

XX

XX

XX

XX

XX

Vectors containing DNA fragments encoding proteins of plant origin
CC with aromatic acyl transferase activity may be used to transform
plants which produce anthocyanin pigments. The aromatic acyl
CC transferase acylates the pigments in the flower resulting in colour
CC transferase acylates the pigments in the flower resulting in colour
CC specific DNA sequences encoding aromatic acyl transferase from
CC different plants are described in AAT37308-T37313. NOTE: This
Sequence is supposed to cross reference with the protein described
CC in AAM04727, however there are so many discrepancies between the
CC polypeptide decoded from this sequence and the polypeptide given in
CC the specification and described in AAW04727 that the indexer decided

                                                                                                                                                                                                                                                                                                                                                           Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.

                                                         Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plants

                                                                                                                                                                                                       Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                              plants

                                                                                                                                                                                                                                                                                                                                    The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                     Nucleic acids containiny electron-transfer group, useful as labels i
hybridization assays, e.g. for genotyping, allowing repeat analyses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1110 GATTCGCGAAGCCTTGCAAAACTGTTATTTCTCGGTGGCGGGATCGAGCAGGCTTGATCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 5.7%; Score 87; DB 22; Length 93

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                             Sequence 938 BP; 4 A; 144 C; 9 G; 5 T; 776 other;

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1388 ATGAAATCCTCTGTTTCATCTCTATTGTTTAAACAATAATTTTTTCCATTGAACTTTTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each conteining an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1388 ATGAAATCCTCTGTTTCATCTCTATTGTTTAAACAATAATTTTTTCCATTGAACTTTTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             иимимимимимимимимимими сстанимимимимимимимимимимимимими 428

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE Generation of ESTs from Potato Leaves Challenged with Phytophthora infestans, Incompatible Reaction JOURNAL Unpublished (2000) COMMENT Contact: Cathy Rouning The Institute for Genomic Research	For clone info: please contact Research Genetics, Libraries Division tel 1-800-711-6195, email cdna@resgen.com Seq primer: M13F-R. FEATURES 1. Gottion/Qualifiers /organism="Solanum tuberosum" /cultivar="Kennebec" /db.xref="Kexon:4113" /clone="HpLI10AA4# /clone="HpLI10AA4# /clone="HpLI10AA4# /clone="lib="P. infestans-challenged leaf" /dov statom="Access colored leaf" /dov statom="Lib="P. infestans-challenged leaf"	/uab_host="SolR" /lab_host="SolR" /note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: Xhoi; Whiche plants were challenged with 450,000 short plants were challenged with 450,000 sporangia/ml P. infestans US-1(US 940501) in Blotron (Madison, Wisconsin). Leaf tissue was collected at 1, 2, 5, 12, and 24 hours post-challenge and frozen in liquid nitrogen immediately upon removal. Kennebec plants showed no signs of HR. Katahdin plants (susceptible to P. infestans. US-1) were used as controls and showed infection. NOTE: We cannot exclude the possibility that this sequence is actually derived from Phytophthora rather than potato."            Autripose potening soil was supplemented with: U.Sog/L.

available phosphoric acid (P205), 20mg/L urea N, 0.16g/L.

S, 0.49mg/L B. 2.5mg/L Cu, 0.15g/L Fe, 13.53mg/L Mn,

0.26mg/L Mo, 14mg/L Zu, 20mg/L Ca, and the following
nutrients in a slow-release form (Osmocote): 0.165g/L
ammonia N, 0.185g/L nitrate N, 0.35g/L available
phosphoric acid, and 0.33g/L soluble potash. No nodules
were visible on the roots at harvest. Stratagene's cDNA
Synthesis Kit (catalog #200401) was used to synthesize the
CDNA. First-strand synthesis was performed with 5-methyl
dCTP, hence the ligated CDNA is hemimethylated.
Stratagene's first-strand synthesis primer was used
GGAGAGAGAGAGAGAACTAGTCTCGAG(T)-18]. After
second-strand synthesis primer was used
GGAGAGAGAGAGAGAACTAGTCTCGAG(T)-18]. After
second-strand synthesis primer with Xiol;
with clone Pfu DNA polymerase, ligated to EcoRI adapters,
and phosphorylated. The XhoI site within the first-strand
synthesis primer was restricted by digestion with Xiol;
all XhoI sites in the CDNA would be protected by their
hemimethylated status. The CDNA constructs were
size-fractionated with a 400bp cutoff, using a SizeSep 400
Spun column from Pharmacia. The column eluent was then
ligated into Stratagene's pBluescript II XR Predigested
vector (pBluescript II SK(+) that had been digested with
ECORI and XhoI, and phosphorylated). Both the white and
blue colonias appear to contain recombinant plasmids with
column inserts. This library was constructed by Dr. Paul
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
